

“With SecureWinbox ID SA engineers can always locate critical system information and intervene quickly”

At ID Integrated Data SA we have used SecureWinbox for many years to store and share sensitive system information's such as passwords, login or URLs.

As an IT services company, we manage many in-house and external systems and we needed to effectively protect our customer's data while maintaining a simple and easy access.

With SecureWinbox ID SA engineers can always locate critical system information and intervene quickly, even in the absence of key employees: "There is nothing more frustrating than getting stuck in front of a server that has restarted because one person is absent and unreachable! ".

With SecureWinbox we have found the following benefits:

- The passwords are centralized and do not go out of the company.
- There are fully private zones that keep your data confidential, even the system administrator cannot view them.
- You can change passwords regularly and all authorized persons can find new information.
- The essential information such as login, URL, address, special TCP port are always available.
- We have an audit log of events on sensitive datas.

SecureWinbox installs easily, does not require any client and updates are regular and easy.
